Multiple Choice Questions

1. (1 point) If $x^{-2}y^3 = 5$, compute $\frac{1}{100}(x^2y^{-3} + 2x^{-10}y^{15})$.
   A. 1250.2
   B. 62.5
   C. 6.25
   D. 6250.2

   Answer: B

   Solution:

$$\underbrace{x^2y^{-3}}_{A} + \underbrace{2x^{-10}y^{15}}_{B}$$

$$A = (x^{-2}y^3)^{-1} = \frac{1}{5} = 0.2$$
$$B = (2(x^{-2}y^5)^3) = 2 \times (5)^5 = 2 \times 3125 = 6250$$
$$A + B = 6250.2$$
$$\frac{(A+B)}{100} = 62.50$$

2. (1 point) Consider the following statements:

   Statement (i): If we take the quotient of two exponentials with the same base, we simply subtract the exponents:

$$\frac{x^a}{x^b} = x^{a-b}$$

   Statement (ii) : This property (provided in Statement (i)) does not hold good when b is greater than a.
   A. Both (i) and (ii) are correct.
   B. Statement (i) is correct but statement (ii) is wrong.
   C. Statement (i) is wrong but statement (ii) is correct.
   D. Both (i) and (ii) are wrong.

   Answer: B

   Solution: Statement (ii) is incorrect.

3. (1 point) There are two sets A and B.

$$A = \{x : x \text{ is a prime number}\}$$
$$B = \{x : x \text{ is an odd number}\}$$

   The universal set is $\mathbb{U} = \{x : 0 \leq x \leq 20\}$.

   What is $B \cap A^c$?
   A. $\{1, 7, 11, 19\}$
   B. $\{1, 9, 15\}$
   C. $\emptyset$
   D. $\{9, 15\}$

   Answer: B

Solution: Write the two sets and their complements.

$$A = \{2, 3, 5, 7, 11, 13, 17, 19\}$$
$$B = \{1, 3, 5, 7, 9, 11, 13, 15, 17, 19\}$$
$$A^c = \{0, 1, 4, 6, 8, 9, 10, 12, 14, 15, 16, 18, 20\}$$
$$B^c = \{0, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20\}$$

Therefore, $B \cap A^c = \{1, 9, 15\}$.

Short Answer Questions-I

4. (1 point) The shortest side of a triangle is given by x cm. The longest side and the third side are given by $4x$ cm and $4x-2$ cm respectively. What is the minimum value of x to have the perimeter greater than or equal to 79 cm?

Solution: **Solution:** The perimeter of a triangle with sides (a, b, and c) is given by $P = a + b + c$. All that we need to do is plug the given values. Let $a = x$, $b = 4x$, and $c = 4x - 2$.

$$\begin{aligned} P &= x + 4x + 4x - 2 \\ P &\geq 79 \quad \text{(given)} \\ x + 4x + 4x - 2 &\geq 79 \\ 9x - 2 &\geq 79 \\ 9x &\geq 81 \\ x &\geq 9 \end{aligned}$$

5. (1 point) Simplify the following expression: $u^3 + v^3 - u^2v - v^2u$.

Solution:

$$\begin{aligned} u^3 + v^3 - u^2v - uv^2 &= u^3 - u^2v + v^3 - uv^2 && \text{(rearranging terms)} \\ &= u^2(u - v) + v^2(v - u) && \text{(taking } u^2 \text{ and } v^2 \text{ as common)} \\ &= u^2(u - v) - v^2(u - v) && \text{(since } (b - a) = -(a - b)) \\ &= (u^2 - v^2)(u - v) \\ &= (u + v)(u - v)(u - v) && \text{(since } (a^2 - b^2) = (a + b)(a - b)) \\ &= (u + v)(u - v)^2 \end{aligned}$$

6. (1 point) Solve for x: $|7 - 3x| \leq 11$.

Solution: If $\epsilon > 0$ then $|x| \leq \epsilon$ if and only if $-\epsilon \leq x \leq \epsilon$. We will use this rule.

$$\begin{aligned} & |7 - 3x| \leq 11 \\ \implies & -11 \leq 7 - 3x \leq 11 \\ \implies & -11 - 7 \leq 7 + (-7) - 3x \leq 11 - 7 && \text{(adding -7 to all sides)} \\ \implies & -18 \leq -3x \leq 4 \\ \implies & \frac{-4}{3} \leq x \leq 6 && \text{(since we are dividing by -3, we must switch signs.)} \end{aligned}$$

Short Answer Questions-II

7. (2 points) Solve for x.

$$\frac{(x+2)+3(x-1)}{x-3} \geq 0$$

Solution: Looking at the LHS, we already know what the value of x is not going to be.

$$x \neq 3$$

$$\frac{(x+2)+3(x-1)}{x-3} \geq 0$$
$$\frac{4x-1}{x-3} \geq 0$$

There are only two scenarios under which the inequality will hold.

Case-I: the numerator has to be positive (or zero) and the denominator has to be positive (can't be zero).

$$4x-1 \geq 0$$
$$x-3 > 0$$

We have: $x \geq \frac{1}{4}$ and $x > 3$. Therefore,

$$x \in (3, \infty)$$

Case-II: the numerator has to be negative (or zero) and the denominator has to be negative.

$$4x-1 \leq 0$$
$$x-3 < 0$$

We have: $x \leq \frac{1}{4}$ and $x < 3$. Therefore,

$$x \in (-\infty, \frac{1}{4})$$

The final answer:

$$x \in (-\infty, \frac{1}{4}) \cup (3, \infty)$$

8. (2 points) In a survey of 35 students, it was found that 15 had taken Mathematics, 12 had taken Physics and 11 had taken Chemistry, 5 had taken Mathematics and Chemistry, 9 had taken Mathematics and Physics, 4 had taken Physics and Chemistry and 3 had taken all the three subjects. Find the number of students that had none of the subjects.

Solution: Let M be the set that contains students who took Maths, P who took Physics, and C who took Chem. Therefore, $n(M) = 15$, $n(P) = 12$, and $n(C) = 11$. We also know that:

$$\begin{aligned} n(M \cap C) &= 5 \\ n(M \cap P) &= 9 \\ n(P \cap C) &= 4 \\ n(M \cap P \cap C) &= 3 \\ n(\mathbb{U}) &= 35 \end{aligned}$$

We are supposed to compute $n(M^c \cap P^c \cap C^c)$.

We know that, for any three sets A, B, C, the following is true:

$$n(A \cup B \cup C) = n(A) + n(B) + n(C) - n(A \cap B) - n(A \cap C) - n(B \cap C) + n(A \cap B \cap C)$$

Given the values, we will apply this formula.

$$\begin{aligned} & n(M \cup P \cup C) = n(M) + n(P) + n(C) - n(M \cap P) - n(M \cap C) - n(P \cap C) + n(M \cap P \cap C) \\ \implies & n(M \cup P \cup C) = 15 + 12 + 11 - 9 - 5 - 4 + 3 \\ \implies & n(M \cup P \cup C) = 38 - 18 + 3 \\ \implies & n(M \cup P \cup C) = 20 + 3 \\ \implies & n(M \cup P \cup C) = 23 \end{aligned}$$

A complement of a set is just all the elements in the universal set excluding the ones within the set. Hence,

$$\begin{aligned} & n(M^c \cap P^c \cap C^c) = n(\mathbb{U}) - n(M \cup P \cup C) \\ \implies & n(M^c \cap P^c \cap C^c) = 35 - 23 \\ \implies & n(M^c \cap P^c \cap C^c) = 12 \end{aligned}$$
