

## Quiz 04 (Set A: Solution)

SIAS, Krea University (AY 2025-26)

Mathematical Methods for Economics (Course Code: ECON211)

12 September 2025

### Multiple Choice Questions

1. (1 point) Consider the following statements:

**Statement (i):**

$f(x) = e^{x-2}$  is a strictly decreasing function.

**Statement (ii):**

$g(x) = x^2 - 2$  is a strictly concave function.

- A. Both (i) and (ii) are correct.
- B. Statement (i) is correct but statement (ii) is wrong.
- C. Statement (i) is wrong but statement (ii) is correct.
- D. Both (i) and (ii) are wrong.

**Answer:** D

**Solution:** A function is strictly decreasing if  $f'(x) < 0$ .

$$\begin{aligned} f(x) &= e^{x-2} \\ \Rightarrow f'(x) &= e^{x-2} \end{aligned}$$

We know that  $e^k$  is always positive (for any constant  $k$ ). Therefore,  $f'(x) > 0$ . Hence, the function is **strictly increasing**.

A function  $g(x)$  is strictly concave if  $g''(x) < 0$ .

$$\begin{aligned} g(x) &= x^2 - 2 \\ \Rightarrow g'(x) &= 2x \\ \Rightarrow g''(x) &= 2 \end{aligned}$$

Since the second derivative is positive everywhere in the domain of the function, the function is **strictly convex**.

2. (1 point) Let  $f(x) = \sqrt{x + \sqrt{x}}$ . Then  $f'(x)$  is

- A.  $\frac{2\sqrt{x} - 1}{4x(\sqrt{x} + x)}$
- B.  $\frac{4\sqrt{x} - 1}{4x(\sqrt{x} + x)}$
- C.  $\frac{2\sqrt{x} + 1}{4\sqrt{x}(\sqrt{x} + \sqrt{x})}$
- D.  $\frac{2\sqrt{x} + 1}{(\sqrt{x} + \sqrt{x})}$

**Answer:** C

**Solution:** Let  $u = x + \sqrt{x}$ . Therefore,  $f(u) = \sqrt{u}$ .

$$\frac{df}{du} = \frac{1}{2\sqrt{u}} \quad \text{(using the power rule)}$$

$$\frac{du}{dx} = 1 + \frac{1}{2\sqrt{x}} \quad \text{(using the power rule)}$$

$$\Rightarrow \frac{du}{dx} = \frac{2\sqrt{x} + 1}{2\sqrt{x}}$$

$$\begin{aligned} \frac{df}{dx} &= \frac{df}{du} \cdot \frac{du}{dx} \\ &= \frac{1}{2\sqrt{u}} \cdot \frac{2\sqrt{x} + 1}{2\sqrt{x}} \quad \text{(applying the chain rule)} \end{aligned}$$

$$= \frac{1}{2\sqrt{x + \sqrt{x}}} \cdot \frac{2\sqrt{x} + 1}{2\sqrt{x}}$$

$$= \frac{2\sqrt{x} + 1}{4\sqrt{x}(\sqrt{x + \sqrt{x}})}$$

3. (1 point) Let  $f(x) = \ln(1 + e^x)$ . Then,  $f''(0)$  is

- A.  $\frac{1}{4}$
- B. 1
- C.  $\frac{1}{2}$
- D. 2

**Answer:** A

**Solution:**

$$f'(x) = \frac{e^x}{1 + e^x} \quad \text{(using the chain rule)}$$

$$f''(x) = \frac{e^x}{(1 + e^x)^2} \quad \text{(using the quotient rule)}$$

$$\Rightarrow f''(0) = \frac{e^0}{(1 + e^0)^2}$$

$$\Rightarrow f''(0) = \frac{1}{2^2}$$

$$\Rightarrow f''(0) = \frac{1}{4}$$

### Short Answer Questions-I

4. (1 point) Let  $xy^2 + 2x^2y = 3$ . Find  $\frac{dy}{dx}$ . Simplify the answer as much as possible.

**Solution:**

$$\begin{aligned}\frac{d(xy^2 + 2x^2y)}{dx} &= \frac{d(3)}{dx} \\ \frac{d(xy^2)}{dx} + \frac{d(2x^2y)}{dx} &= 0 && \text{(applying the sum rule to the LHS and the constant rule to the RHS)} \\ x \frac{d(y^2)}{dx} + y^2 \frac{d(x)}{dx} + 2x^2 \frac{d(y)}{dx} + 2y \frac{d(x^2)}{dx} &= 0 && \text{(applying the product rule)} \\ 2xy \frac{dy}{dx} + y^2 + 2x^2 \frac{dy}{dx} + 4xy &= 0 \\ (2xy + 2x^2) \frac{dy}{dx} + (y^2 + 4xy) &= 0 \\ (2xy + 2x^2) \frac{dy}{dx} &= -(y^2 + 4xy) \\ \frac{dy}{dx} &= -\frac{(y^2 + 4xy)}{2xy + 2x^2} \\ \frac{dy}{dx} &= -\frac{y}{2x} \left( \frac{4x + y}{x + y} \right)\end{aligned}$$

5. (1 point) Let  $f(x) = \ln(2 + e^{x-3})$  and let  $g(x) = f^{-1}(x)$ . Find  $g'(x)$ .

**Solution:** Let  $y = f(x)$ .

$$\begin{aligned}y &= \ln(2 + e^{x-3}) \\ \Rightarrow e^y &= 2 + e^{x-3} && \text{(since } e^{\ln(a)} = a) \\ \Rightarrow e^{x-3} &= e^y - 2 \\ \Rightarrow x - 3 &= \ln(e^y - 2) && \text{(taking log on both sides)} \\ \Rightarrow x &= 3 + \ln(e^y - 2) \\ \Rightarrow f^{-1}(x) &= 3 + \ln(e^x - 2) \\ \Rightarrow g(x) &= 3 + \ln(e^x - 2) \\ \Rightarrow g'(x) &= \frac{1}{e^x - 2} \frac{d}{dx}(e^x - 2) && \text{(applying the chain rule)} \\ \Rightarrow g'(x) &= \frac{e^x}{e^x - 2}\end{aligned}$$

6. (1 point) Without using calculus, compute the minimum (or the maximum) value of the following function:  $f(x) = (x - 2)^2 + 5$ . (*Hint: Graph the function.*)

**Solution:** Consider  $(x - 2)^2$ . The minimum value that any square can take is zero. Therefore,  $(x - 2)^2 \geq 0$ . When  $x = 2$ ,  $f(x) = 5$ . This is the minimum value of the function.

## Short Answer Questions-II

7. (2 points) Find and classify all the stationary/inflection points for the following function:  $f(x) = x^3 - 3x$ .

**Solution:**

$$f'(x) = 3x^2 - 3$$

$$f''(x) = 6x$$

Set the first derivative to zero to find the stationary points.

$$3x^2 - 3 = 0$$

$$x^2 - 1 = 0$$

$$x^2 = 1$$

$$x = \pm 1$$

When  $x = 1$ , the second derivative is positive indicating a local minimum. When  $x = -1$ , the second derivative is negative suggesting a local maximum.

Set the second derivative to zero to look for inflection point(s).

$$6x = 0$$

$$x = 0$$

Take any two points in the vicinity of  $x = 0$ . Luckily, we already have those points from our previous calculation. Since the sign of

the second derivative changes as  $x$  moves around  $x = 0$ ,  $x = 0$  is an inflection point.

$x = 1$	<b>Local maximum</b>
$x = -1$	<b>Local minimum</b>
$x = 0$	<b>Inflection point</b>

8. (2 points) You work for an online retailer and you have been tasked with estimating the elasticity of demand for their product. The demand function is  $q = \frac{2}{3}\sqrt{144 - p^2}$ .

(a) (1 point) Compute the elasticity of demand when  $p = 6$ .

**Solution:** We know that:

$$\epsilon_p = \left| \frac{p}{q} \cdot \frac{dq}{dp} \right|$$

When  $p = 6$ ,

$$\begin{aligned} q &= \frac{2}{3}\sqrt{144 - 36} \\ &= \frac{2}{3}\sqrt{108} \\ &= \frac{12\sqrt{3}}{3} \\ &= 4\sqrt{3} \end{aligned}$$

Let's compute  $\frac{dq}{dp}$ .

$$\begin{aligned} \frac{dq}{dp} &= \frac{1}{3}(144 - p^2)^{-\frac{1}{2}} \left( \frac{d(144 - p^2)}{dp} \right) && \text{(applying the chain rule)} \\ \frac{dq}{dp} &= \frac{-2p}{3(144 - p^2)^{\frac{1}{2}}} \end{aligned}$$

When  $p = 6$ ,

$$\begin{aligned} \frac{dq}{dp} &= \frac{-12}{3(6\sqrt{3})} \\ &= \frac{-2}{3\sqrt{3}} \end{aligned}$$

The elasticity of demand,

$$\begin{aligned} \epsilon_p &= \left| \frac{p}{q} \cdot \frac{dq}{dp} \right| \\ \epsilon_p &= \left| \frac{6}{4\sqrt{3}} \cdot \frac{-2}{3\sqrt{3}} \right| \\ \epsilon_p &= \frac{1}{3} \end{aligned}$$

- (b) (1 point) Based on your previous answer, what should be the firm's pricing strategy (increase or decrease the price?) that will boost revenue? Explain briefly.

**Solution:** The demand, our previous computation suggests, is inelastic. Therefore, the retailer can increase the price a bit to boost the revenue.
